n.a. not discernible, neglectable versus 1°C temperature variation.

❶ after 48 hours of continuous operation. Typical value for PM 9692 is 1 x 10⁻¹⁰ / 24h

❷ after 1 month of continuous operation

❸ typical value, aging during 10 years: < 1 x 10⁻⁹

❹ after 1st year, aging during 1st year: < 3 x 10⁻⁷

Explanation

- Calibration Adjustment Tolerance: Is the maximal tolerated deviation from the nominal 10MHz frequency after a calibration. When the reference frequency does not exceed the tolerance limits at the moment of calibration, an adjustment is not needed.

- Total uncertainty Is the total possible deviation from the nominal 10MHz value under influence from frequency drift due to aging and ambient temperature variations versus the reference temperature. The operating temperature range and the calibration interval are part of this specification.
